

Supplementary Table 3. Structural parameters of CYP21A2 variant residues.

Description: This table lists the physicochemical properties, solvent accessible surface area (SASA), and percentage of total SASA contributed by side chains for both wild-type (WT) and mutant residues. SASA values were calculated in PyMOL using the crystal structure of CYP21A2 (PDB ID: 4Y8W, chain A), with a probe radius of 1.4 Å. Relative solvent accessibility (RSA) was derived by normalizing total SASA against the theoretical residue SASA values proposed by Tien et al. (2013). Δ RSA represents the difference in relative solvent accessibility between mutant and wild-type residues (Δ RSA = MUT_RSA – WT_RSA).

All SASA values are expressed in Å².

Identifiers	Location	WT/Mutant	Physicochemical Properties	SASA (Angstrom ²)					Δ RSA=MUT_RSA- WT_RSA
				RSA (%)	Total SASA	Main-chain	Side-chain	Percentage of total SASA contributed by side chain (%)	
p.R76K	Surface	p.R76	Basic; Hydrophilicity Secondary structure: α -helix	69.05	189.19	12.16	177.03	93.57	-1.66
		p.K76	Basic	67.38	159.02	13.09	145.93	91.77
